Progression of Calculations through Reigate St Mary's

Formal methods of Calculations Guidance

Policy Author:

10 September 2023

Rationale

At St Mary's, we believe a clear progression in calculation will support the learning and teaching of Maths throughout the school, allow clarity and provide a secure foundation upon which to build and develop mathematical skills. The aim is to have a steady progression of understanding in Maths as your child moves through school. Different methods are taught, but they have been chosen to build on one another, according to the level your child is working at, rather than which year group they are in.

This policy contains the key pencil and paper procedures that will be taught within St Mary's and should be read alongside the Maths Policy. Although the focus of the policy is on pencil and paper procedures it is important to recognise that the ability to calculate mentally lies at the heart of the Maths framework. In every written method there is an element of mental processing. Sharing written methods with the teacher encourages children to think about the mental strategies that underpin them and develop innovative ideas. Therefore, written recording both helps children to extend and clarify their thinking. Children should be encouraged to see mathematics as both a written and a spoken language.

Teachers should support and guide children through the following stages:

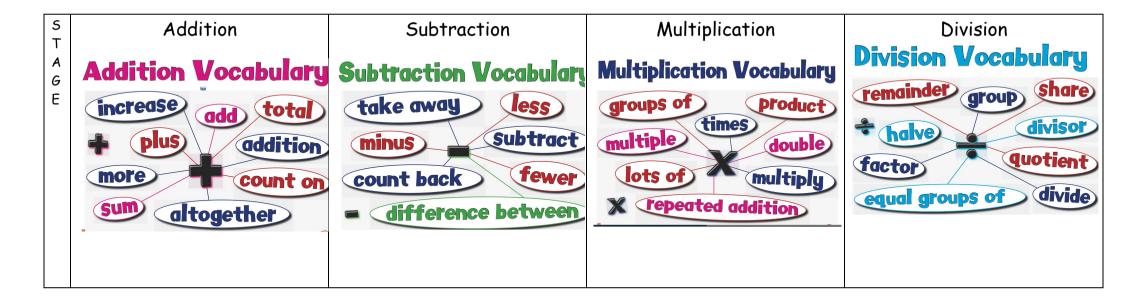

- 1. Develop the use of pictures and use of words and symbols to represent numerical activities.
- 2. Use standard symbols and conventions.
- 3. Use of jottings to aid a mental strategy.
- 4. Use of pencil and paper procedures.
- 5. It is important that children do not abandon jottings and mental methods once other pencil and paper procedures are introduced. Children will always be encouraged to look at a calculation/problem and then decide on the best method.

<u>Progression in calculation should include:</u>

A range of mental strategies to be used as a first resort, even once written methods have been introduced and embedded.

- 1. An ability to understand and use the relationships between the four operations of number.
- 2. An ability to explain, describe and record their methods.
- 3. An ability to estimate and check whether the answer is correct.
- 4. An ability to solve a wide range of problems involving calculation in a wide variety of contexts.
- 5. An ability to choose and use the most appropriate method of calculation; mental, jottings, written or using a calculator.
- 6. An ability to take the initiative to return to an earlier method that children are more confident with.

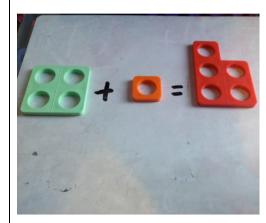

This policy shows the progression in each operation (addition, subtraction, multiplication, and division.) All methods should be taught with understanding rather than by rote and put into real life contexts. Differentiated outcomes throughout the progression will be the size of the numbers the children are using.

	Addition	Subtraction	Multiplication	Division
1	Children are encouraged to develop a mental picture of the number system in their head for calculation. They develop ways of recording calculations using pictures, Numicon etc They handle objects for early addition work. Ala: Largest Number 1st 5 + 3 = 8	Before children can move onto the methods for subtraction, they need to be able to count reliably including one to one. The children will be supported with these concepts through singing Nursery Rhymes and develop ways of recording calculations using pictures or using apparatus, such as Numicon correspondence.	Children will experience equal groups of objects. They will count in 2s and 10s and begin to count in 5s. They will work on practical problemsolving activities involving equal sets or groups. Numicon will be used to help the children to visualise the grouping of numbers and to support counting on as repeated addition. How many legs will 3 teddies have?	Children will understand equal groups and share items out in play and problem solving. They will count in 2s and 10s and later in 5s. They will experience the language of sharing early on; sharing of toys, fruit etc, and will have experienced the idea of groups - by working in a practical way practical way group with an adult or sorting toys or objects into groups of the same colour for instance. They will draw pictures in groups or sets. Division will be explored using grouping (with numicon, then number line)

Addition

1 2 3 4 5 five 1 5 five 6 7 8 eight nine ten

They use numberlines (Slide C1A) and practical resources to support calculation and teachers demonstrate the use of a numberline.

Subtraction

back from any number

Children will understand subtraction as taking away

Children will begin to know the inverse relationship of number facts to 20

Children will subtract numbers using equipment and Numicon (start by subtracting the units first in preparation for later work).

S1: Objects

7 - 3 = 4

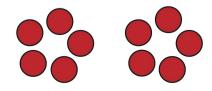

"What do I get if I take 3 away from 7? Answer: 4"

Multiplication

Numicon tiles are essential for making lots of and aiding the counting in fives and other numbers.

(M1: Groups)

***2** groups of **5** counters makes **10** counters altogether"

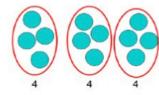

Division

Grouping:

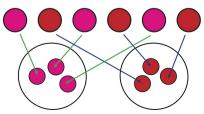

Sharing:

12 shared between 3 is 4

A child groups the objects by sorting.

D1: Sharing (Concept)

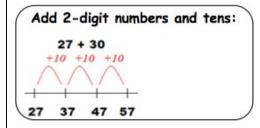

"If I share 6 into 2 equal amounts, how many in each group?" Answer: 3

Addition	Subtraction	Multiplication	Division
C1a: Number Order	S2: What's the Difference?		
0 1 2 3 4 5			
The Numbers must be said once and always in the conventional order.	7 - 5 = 2 "How many more is 7 than 5? What is the difference?"		$12 \div 3 = 4$ Children will halve numbers and work
Children need to count on from any number, combining two groups (slide c6)			out simple fractions of numbers
C6: Counting On			
8 9 10 11 12 13			
Children will recognise that addition can be done in any order.			
Children will begin to know addition facts to ten.			
Children will be able to count on in			

	Addition	Subtraction	Multiplication	Division
	ones on a numbered line. Children will be able to use more efficient jumps, starting with the larger number and counting on in ones. 4+6 5+5 6+4			
2	Children are encouraged to develop a mental picture of the number system in their head for calculation. They develop ways of recording calculations using pictures, numicon etc (slide A1a) Pupils to recognize the effect of adding and subtracting zero Children then begin to use numbered lines to support their own calculations using a numbered line to count on in	Children are encouraged to develop a mental picture of the number system in their head for calculation. They develop ways of recording calculations using pictures, numicon etc The numberline should be used to show that 6-3 means the difference between 3 and 6 and how many jumps they are apart.	Children will experience equal groups of objects They will count in 2s and 10s and begin to count in 5s. They will work on practical problemsolving activities involving equal sets or groups. Numicon will be used to help the children to visualise the grouping of numbers and to support counting on as	The children will be able to divide objects into equal groups They use counters, bears, Numicon or other objects to group with to solve problems. They will begin to recognise how times- table facts can help them and see the inverse relationship between division and multiplication.

Addition

Children can count on using a marked unlabelled **number line**, then by drawing their own number lines

Bead strings can be used to illustrate addition including bridging through ten.

Bead strings or bead bars can be used to illustrate addition including bridging through ten by counting on 2 then counting on 3.

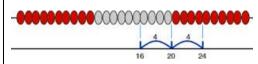

8 + 5

They begin to use jumps of various sizes, applying number bond knowledge to help them 'bridge' to the next 5 or 10. (slide A2a)

Subtraction

Bead strings can be used to illustrate subtraction using bridging through ten by counting back 4 then counting back 4.

24-8=16

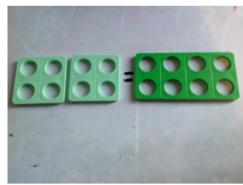

Children can count back using a marked unlabeled number line, then by drawing their own They use their knowledge of number patterns to count

Empty number line back in different sized jumps.

Multiplication

repeated addition

The children will understand double as two equal groups of objects or numbers.

They will be able to draw arrays.

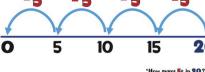

The children will be able to represent jumps of 2, 5 and 10 on a numbered number line and relate it to the concept of **repeated addition**.

Division

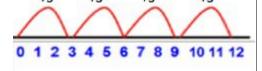

Groupings using a number line

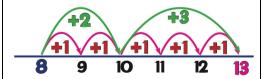

$$12 \div 3 = 4$$

Addition

Subtraction

A2a: Counting On

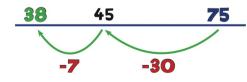

$$8 + 5 = 13$$

Pupils will understand the words sum and total

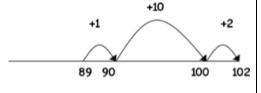

Pupils count in fractions up to 10

S7: Backwards Jump

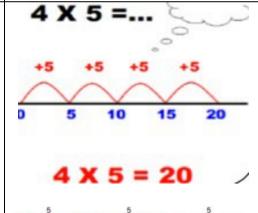

$$75 - 37 = 38$$

Where the numbers are involved in the calculation are close together or near to multiples of 10, 100 etc counting on using a number line should be used. 102 -89 = 13

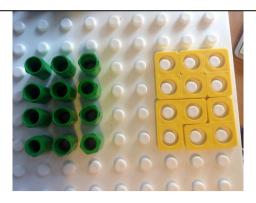

Multiplication

They will see the relationship between addition and multiplication: 2+2+2+2=10 being the same as $5 \times$ 2= 10.

Numicon tracks and Cuisenaire Rods will help the children to visualise the grouping and repeated addition concept.

Division

Or as shown on the Numicon 12 divided by 3 = 4

Or repeated subtraction

e.g. 12 take away 3, take away3 more, take away 3 more and take away 3

Children will begin to use empty number lines themselves starting with the larger number and counting on

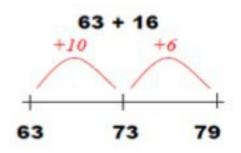

First counting on in tens and ones

Then helping children to become more efficient by adding the units in one jump

(by using known facts e.g., 3+4=7)

Followed by adding the tens in one jump and the units in one jump.

Bridging through ten can help the children to become more efficient.

Children will use partitioning to see how numbers are broken down into their different values. Children will be introduced to expanded subtraction.

$$87 - 23 = 64$$

80

7

20

3

(\$10: Expanded Subtraction)

⁶⁰70

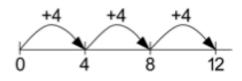

5

30

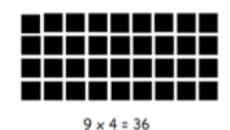

30 8

Children will develop their understanding of multiplication and use jottings to support calculation

Repeated addition

4 times 9 is 9+9+9+9 or 9 lots of 4 or 4x9

Children will be comfortable with the concept of multiplying and dividing by powers of ten

Children will develop their understanding of division and use jottings to support calculation

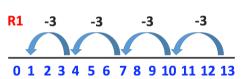

Sharing equally

6 sweets shared between 2 people, how many do they each get?

Repeated addition using a number line or beads

Grouping on a number line

$$13 \div 3 = 4 r 1$$

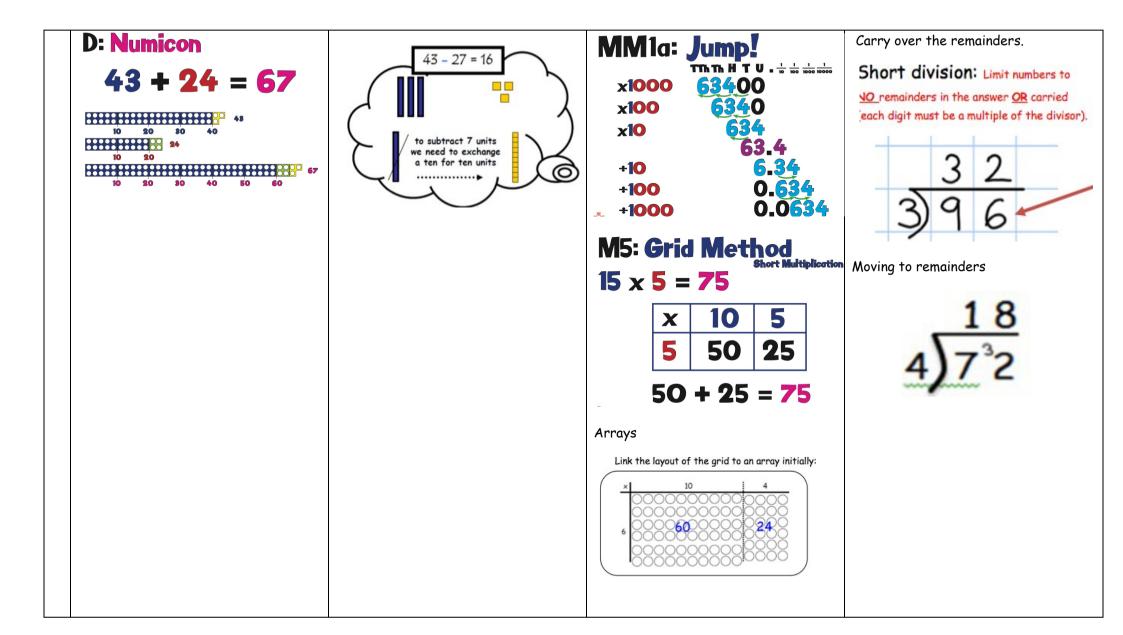

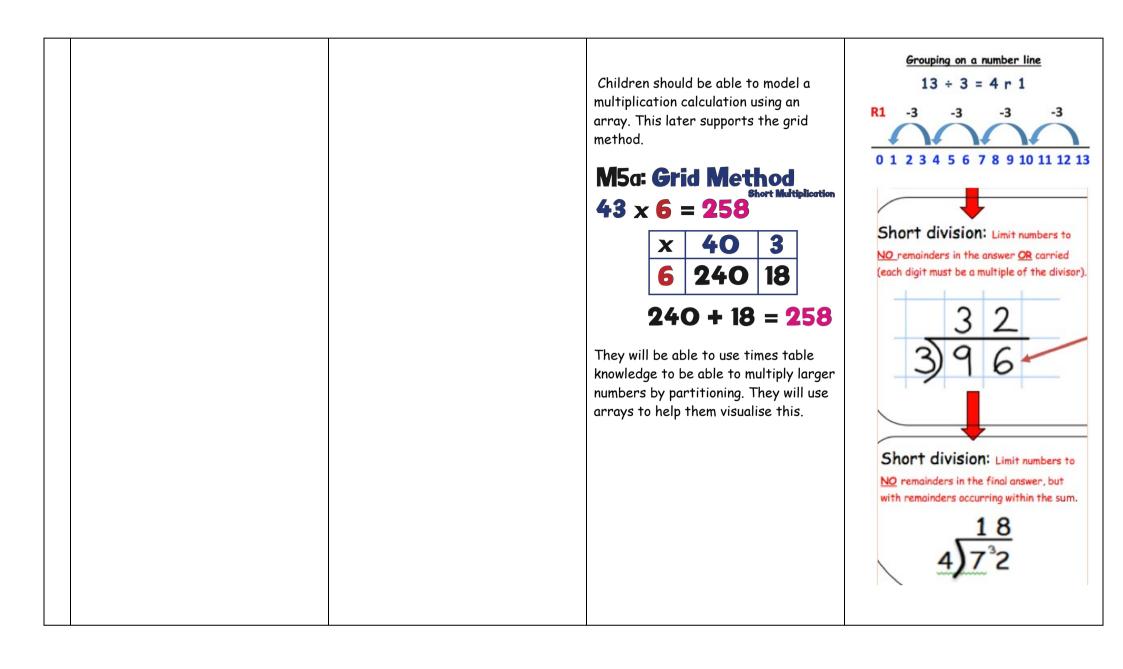

Using symbols to stand for unknown numbers to complete equations using inverse operations

Short division for larger 2 digit numbers Bus shelter method The number being divided (the dividend) in the middle (under the shelter).

2. Start by looking at the most significant number and work out how many

times it can go into the number.

	(D10: Short Division) 72 ÷ 4 = 18 18 4732

4 Children will continue to use empty number lines with increasingly large numbers, including compensation where appropriate

Count on from the largest number irrespective of the order of the calculation

Children will use partitioning to see how numbers are broken down into their different values. Children will be introduced to the expanded column method for larger numbers before moving quickly onto the formal column method as they will then have developed an understanding of the process

Adding the least significant digits first in preparation for 'carrying.' Formally moving to the column method

Children will continue to use empty number lines with increasingly large numbers

They will use the expanded column method (known as decomposition) to partition the number and subtract each place value separately always starting with the least significant digits (e.g. the units). It is very important they understand the importance of keeping the digits lined up.

	2	7	5	4	_	ı	5	6	2	=	١	1	9	2
	2	0	0	0		60	0	•		-	۸	_	И	
-	1													
	_			0			_				_	_	_	

First they will work with numbers that have no exchanging (e.g. the units or tens of the number being subtracted is smaller than the starting number).

Next they will learn how to exchange from the tens to the units. They need to recognise when the starting number's units have less than the number being subtracted. When this is the case they need to 'exchange' 10 from the tens into the units, in order to be able to subtract the numbers. It

Children will become confident with the grid method

Developing the grid method:

Eq.
$$136 \times 5 = 680$$

X	100	30	6
5	500	150	30

500

150

+ 30

680

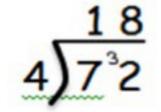

M5: Grid Method

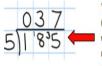

$$15 \times 5 = 75$$

X	10	5
5	50	25

$$50 + 25 = 75$$

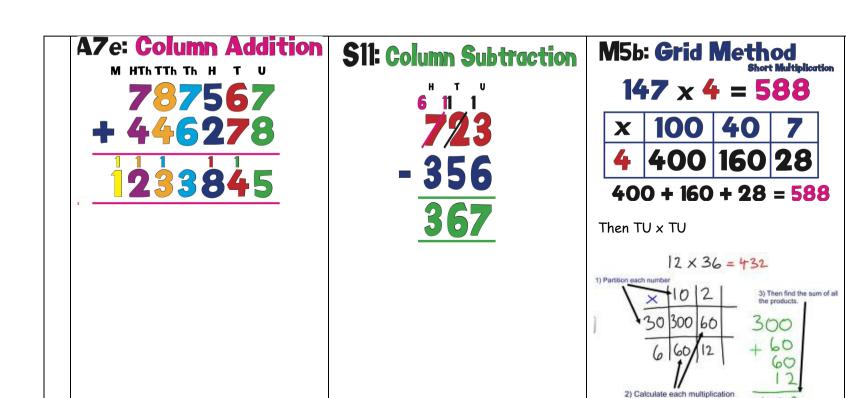

The children will understand how to deal with remainders in a real life context

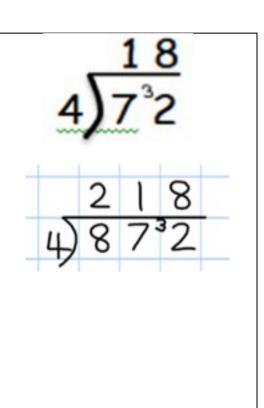

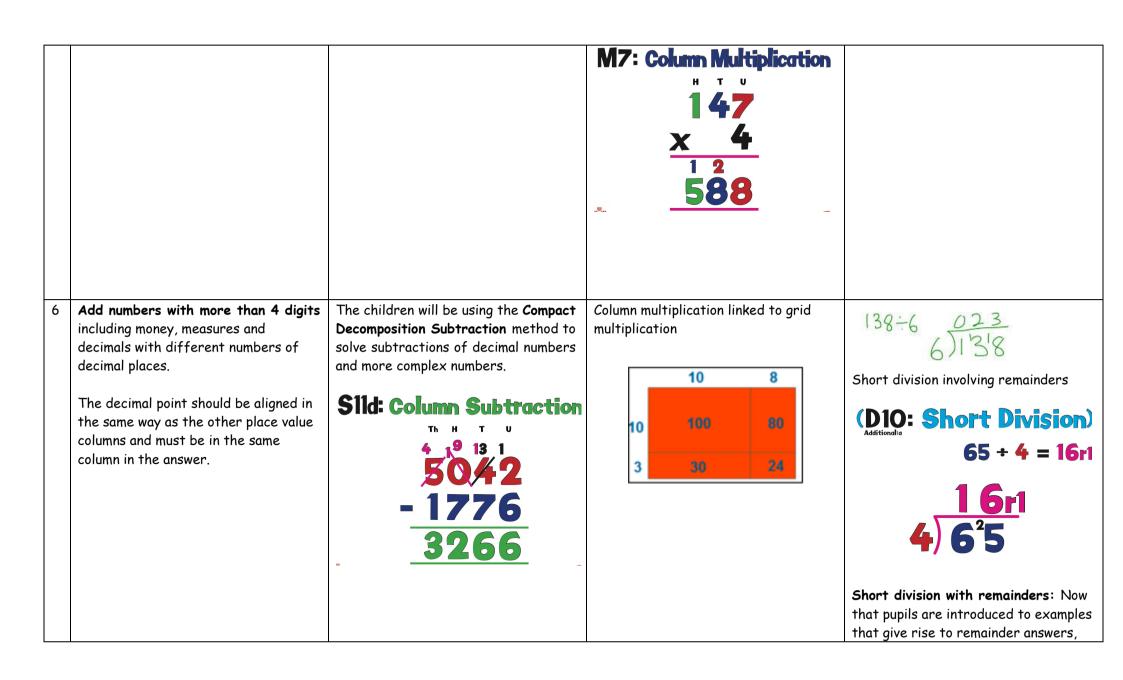

When the answer for the first column is zero (1 + 5, as in example), children could initially write a zero above to acknowledge its place, and must always 'carry' the number (1) over to the next digit as a remainder.

	of addition(Slide A7) (A7: Column Addition) 57 +25 -82	is important the children understand the tens have to come over to the units as a whole 10. The Base 10 (Dienes) apparatus helps the children to visualise what happens and how the exchange takes place. We also use place value counters. 2		
5	Move from expanded addition to the compact column method, adding units first, and carrying numbers above the calculation. Also include money and measures contexts.	Children will be able to subtract using the Compact Decomposition Method and understand the importance of lining up each digit.	Children will continue to use arrays where appropriate using the grid method of multiplication Grid method as stage 4 HTU x U	Continue to develop short division/bus stop method This method relies heavily on times tables knowledge - 2 digit numbers divided by single digit Then 3 digits divided by a single digit

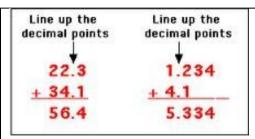

Column multiplication is introduced

	A7j: Column Addition 73.4 + 5.67 = 79.07 73.4 + 5.67 79.07 A7i: Column Addition With Moreg £38.25 + £27.46 £65.71	**************************************	M7: Column Multiplication 147 x 4 12 588 Working towards more complex numbers M9a: Long Multiplication Th H T U 243 x 68 1944 (8 x 243) + 14580 (60 x 243) 16524	division needs to have a real life problem solving context, The pupils consider the meaning of the remainder and how to express it, i.e. as a fraction, a decimal, or as a rounded number or value, depending upon the context of the word problem.
7	To be able to use their knowledge of place value to know how to add 1.234 to 4.1 To know how to add numbers of increasing complexity e.g. 81,059,3,668,15,301 and 20,551.	Decimal subtractions	Multiplying decimals with one decimal place either by grid or long multiplication column	This method relies heavily on times tables knowledge. It can be used to supply an answer with decimal places and it can be used to convert fractions to decimals.

MA3: Number Bonds

S11f: Column Subtraction

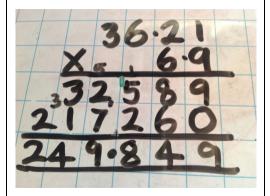

M8e: Grid Method Long Multiplication

 $7.38 \times 6 = 44.28$

X	7	0.3	0.08
6	42	1.8	0.48

42 + 1.8 + 0.48 = 44.28

Being comfortable to do decimal adjustments

D10f: Short Division

169.2 5 846.0

846 ÷ 5

169r1 5/8'4'6 169 ¹/₅ 5 8 4 6
